NON-INCENDIVE INTRINSICALLY SAFE AND EXPLOSIONPROOF

Smart positioners for both spring-return and double-acting actuators on rotary and linear valves. Available with HART®, FOUNDATION Fieldbus™ and Profibus PA™ protocols.

### **GENERAL APPLICATION**

SmartCal intelligent positioners provide a range of options for actuator calibration, position feedback, performance verification and control valve status intelligence.

### **TECHNICAL DATA**

### **Enclosures**

Engineered resin Aluminum Stainless steel

### Communication protocol

FOUNDATION Fieldbus™ Profibus PA™

# **FEATURES**

- Non-contact valve position measurement via Hall effect sensor. Eliminates the need for drive arms, linkages and increases overall resolution, accuracy and reliability.
- 3-button interface and graphical LCD for auto-calibration and information display.
- Negligible bleed for reduced air consumption.
- Single button advanced auto-calibration.
- Valve speed adjustable via user control.
- Easy configuration of split range and reverse acting operation.
- High-flow spool valve option for larger actuator/valves. Eliminates the need for volume boosters in some applications.
- Standard 4-20 mA position feedback transmitter - HART® version only.
- Available with optional dry contact limit switches.
- Highly visible position indicator for rotary applications.
- Easily accommodates large stroke valves, such as knife gates.
- Fully compatible with AMS™ software and
- Rugged aluminum and stainless steel enclosures for maximum protection.
- Engineered resin enclosure is robust yet lightweight with exceptional chemical, UV and impact resistance.

SmartCal on a typical linear diaphragm valve

### **NON-CONTACT POSITION FEEDBACK**

Unlike conventional positioners, the SmartCal feeds back accurate valve position without the need for linkages, levers and rotary or linear seals. Position sensing is performed by a non-contact sensor, employing Hall effect magnetic principles. This enables the use of advanced control strategies where knowledge of valve position is used in predictive and other algorithms.

### **ROTARY CONTROL**

There is no hysteresis within the positioner. This feature allows extremely accurate tracking of the control signal to within 0.1 mA. The noncontact position sensor is embedded within the SmartCal housing. An external magnetic module, attached to the output shaft of the actuator and housed in the indicator assembly, rotates about this sensor. An analog-to-digital converter interfaces between the sensor and a microprocessor. It rotates about this sensor generating position signal which is linearized to improve accuracy and linearity of the controlled position commanded by the instrument signal.

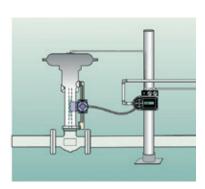

### **LINEAR CONTROL**

The SmartCal non-contact proximity sensor provides a reliable measurement of valve stem position. A static slide-by trigger magnet, attached to the valve stem, is the only moving part. Output updating takes place twenty times per second.

The SmartCal is a fully digital positioner allowing for multiple control algorithms leading to better controllability for a large range of actuators and enables a wide range of diagnostic information to be generated.

### **REMOTE MOUNT CAPABILITY**

The SmartCal has the ability to be mounted remotely (up to 15 m/50 feet) from the device it is controlling (Please consult about greater distances). This allows the positioner to be isolated if the control valve is located in either a high vibration or extremely corrosive environment.

Pipe mount SmartCal with remote and cable set

NON-INCENDIVE INTRINSICALLY SAFE AND EXPLOSIONPROOF

### Negligible bleed

The SmartCal positioner is designed to consume the least possible amount of control air at steady state. This means lower process air consumption and reduced demand on instrument air compressors. To increase reliability, the SmartCal employs a patented lapped spool and floating sleeve design. This balanced construction relies on an air bearing which eliminates any metal-to-metal contact and results in a mean time between failures (MTBF) of 1,666,666.7 hours or 333.3 years.

### Integrated position transmitter

The SmartCal is available with an integrated 4-20 mA position feedback transmitter. This cost-effective feature eliminates the need to buy externally mounted devices when knowledge of valve position is required remotely.

### AutoCal intelligent calibration, local keypad

SmartCal intelligent positioners are equipped with a 3-button keypad for performing on-site electronic calibration. System calibration is performed easily, requiring only minutes to accomplish. It offers the operator a choice of linear, quick-opening or equal percentage modes. Split range and reverse acting operation are also configured simply.

The single button AutoCal feature allows simple zero and span adjustments as well as PID and transducer calibration. SmartCal positioners offer the option of HART®, FOUNDATION Fieldbus™ or Profibus PA.

## On-board sensors/error detection

The SmartCal positioner has the capability to constantly monitor its own operation. If an error or failure condition occurs, it will be displayed on the local LCD. If the positioner is supplied with a HART® interface, the error codes are displayed on a hand-held terminal or PC maintenance station as shown below:

Err3 = Low input pressure or clogged filter Err6 = Calibration error

AVID
SmartCal HART Rev 25.5°C
R %PS 56.4 %SP 56.4
12.0mA ERR3

The alarm conditions and additional diagnostic capabilities are provided through a number of sensor elements in the transducer. A pressure switch detects low air pressure entering the positioner. In conjunction with a supply pressure switch, it can be identified whether this is caused by a restricted filter or a genuine low supply pressure condition. A 0-100% position feedback transmitter is available integrated within the positioner's electronics.

### Local LCD display

The local LCD display provides a range of onsite diagnostic information. While the valve is being controlled by the positioner and the error signal is NOT zero, the displayed information will show both setpoint and position as a percentage. The range of values displayed is from 0.0% (fully closed) to 100% (fully open). The resolution displayed is in 0.1% increments although internal calculations are maintained more precisely.

AVID
SmartCal HART Rev 25.5°C
R %PS 56.4 %SP 56.4
12.0mA ACAL

### PID control

The SmartCal uses proportional, integral and derivative functions, making it a true PID servo system. By combining intelligence based on present, past and the prediction of future events, the SmartCal's controller is able to minimize errors and provide a precise control response.

### **Autotuning**

Tuning, or setting of the PID functions, is carried out automatically by the microprocessor within the SmartCal. This eliminates complex and time-consuming manual procedures.

### HART® protocol

The SmartCal positioner responds to HART® commands for ease of calibration and provides intelligence for the control valve through a microprocessor-based diagnostic system utilizing the HART® protocol.

### FOUNDATION Fieldbus™ protocol

The SmartCal also features the FOUNDATION Fieldbus™ communication protocol, is an industry proven international standard (IEC 61158) designed for use in the process industry. Its features include multi-drop capabilities (as many as 32 devices per segment), extended trunk length, and single loop integrity. It also offers control in the field, power and communications on a shielded twisted pair network and compatibility with intrinsically safe networks.

A key feature of the FF protocol is the ability to select where control of the process is situated – in the host, in the field or in various combinations of both locations.

### Profibus PA™ protocol

The SmartCal also features the Profibus PA™ communication protocol.

Similarly to the Foundation Fieldbus devices, Profibus PA<sup>TM</sup> (Process Automation) physical layer confirms to the IEC61158-2 international industry proven standard allowing for multidrop communication to 32 devices per segment and extended trunk length.

The SmartCal is an intrinsically safe positioner utilizing single, twisted pair shielded cable for power and communication. Functional advantages include transmission reliability, self-test functions, diagnostic, distributed intelligence, local and remote auto-calibration. To simplify integration of SmartCal provides GSD (General Station Description) containing key device data as well as EDD (Electronic Device Description) and DTM (Device Type Manager).

### SMARTCAL INTELLIGENT POSITIONERS WITH HART®, FOUNDATION FIELDBUS™ AND PROFIBUS PA NETWORK CAPABILITIES

### Proven, Interoperable solutions even in the Harshest Environments

The SmartCal positioner series has been successfully used for more than 15 years in many challenging and diverse applications in industries such as, Oil and Gas, Chemical, Power, Pulp and Paper and Sugar and Ethanol. Although it has a proven track record, constantly improving the SmartCal line of positioners. Recent developments have enhanced the SmartCal electronics robustness and performance even when submitted to vibration and EMI. In the mechanical arena. an explosion proof solution and stainless steel housing option is now available. Software upgrades ensure the SmartCal is up to date with the most recently released industry standards, like the FF's ITK 6.0.1 (one of the first in the market) and the SmartCal is now compatible with the Profibus PA protocol.

Our goal is to provide the SmartCal user with a truly open, independent and interoperable solution able to interface with different host system brands and vendors.

In order to support the integration of SmartCal positioners in to the user's host system of choice, you can download all the necessary HART®, Fieldbus Foundation or Profibus files from the internet. Please visit:

### Additional features and benefits

SmartCal provides intelligence to the control valve through microprocessor-based systems using the HART®, FOUNDATION Fieldbus™ and Profibus PA protocols respectively. These offer additional benefits in intelligent calibration, control and on-line diagnostics.

### Intelligent calibration

Accurate measurement of valve stem position, input signal, actuator pressure, cycle time and cycle count data are recorded during normal operation, providing information for control valve signature generation. The positioner has a local LCD display which indicates valve position, set-point in percentage open, calibration status, alarms status and, for the FOUNDATION Fieldbus and Profibus PA versions, whether the SmartCal is in local or fieldbus control.

### Intelligent control

Control valves are the most maintenanceintensive components commonly used in instrumentation and control systems. Internal parameter sensing within the valve positioner gives early warning of the need for maintenance.

### On-line diagnostics

The SmartCal possesses the capability to predict rather than react to valve maintenance needs. Operating personnel gain a real time perspective on the state of control at the valve, including a view of operating integrity and emerging alert conditions. Timely information about each control valve's condition is quickly made available to the plant's production and maintenance engineers.

The principal advantage of online diagnostics is the ability to detect deviations from established patterns of behavior as they occur under actual operating conditions.

The SmartCal positioner's diagnostic capability observes the following parameters:

- Valve position vs. input signal.
- Actuator pressure vs. valve position.
- Airset filter outlet pressure.
- Confirmation of principal operating pressures within the positioner.
- Pressure generation within packing gland area
- These enable the following to be diagnosed:
  - 'Stick-slip' detection.
  - Excessive static position error.
  - Low air supply pressure.
  - Clogged air supply filter.
  - Restricted transducer nozzle.
  - Transducer diaphragm air leak.
  - Non-functioning spool valve.
  - Calibration error

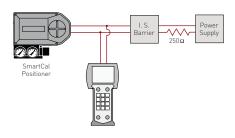

### NON-INCENDIVE INTRINSICALLY SAFE AND EXPLOSIONPROOF

### **HAND-HELD TERMINALS**

### **HART®**

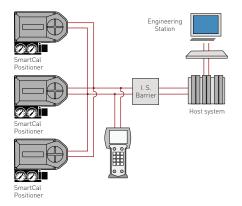

A single 4-20 mA SmartCal positioner with up to two master devices may be connected to each HART\* loop. The primary master is generally a management system or a PC while the secondary unit can be a handheld terminal or laptop computer.

A standard hand-held HART\* Communicator is available for making field operations as uniform as possible. Communication is accomplished by superimposing a high frequency signal on top of the 4-20 mA output signal. This allows simultaneous communication and output without comprising loop integrity.

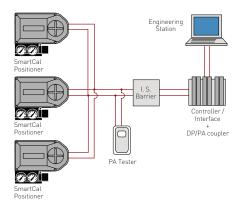

### Foundation Fieldbus

Foundation Fieldbus compatible hand held terminals (like the Rosemount Field Communicator) can communicate with SmartCal positioners via the FF protocol.

### Profibus PA

Similar to the Fieldbus Foundation, a Profibus PA tester, like the MTL FBT6-PA, can be used in hazardous areas. Several testers and bus analyzers are also available to be used directly from the DP network in the safe area.
